NSAIDs and cardiovascular risk

Patients taking non-aspirin NSAIDs may be at a risk of exacerbating existing CVD.

The FDA and Drug Administration have reviewed the evidence regarding the association between non-steroidal anti-inflammatory drugs (NSAIDs) and the risk of cardiovascular events such as heart attack and stroke.

Data from the OTC NSAIDs Committee has shown that NSAIDs have been associated with an increased risk of cardiovascular complications in patients with hypertension or a history of cardiovascular disease.

- Bears all these warnings in mind and tailor recommendations to a patient’s particular needs and health status.

1. NSAIDs may interact with medications commonly used in patients with CVD risks.
